iVet

What is iVet?

iVet is a people vetting service from iSentry that helps organisations ensure that their staff and prospective employees are who they say they are. Simple and very cost effective, iVet is offered as a web based managed service that requires no servers or software to be deployed.

iVet is ideal for employers, recruitment agencies and HR professionals looking for an extra level of trust. iVet helps trap and prevent identify theft by verifying the source of your data (driving license/passport) and then cross-referencing the details provided against a variety of identity databases and sources including;

- \ The electoral roll
- \ Utility companies
- \ Telephone companies
- \ Birth and mortality lists
- \ International Sanction lists

How does it help you as a recruitment agency?

Recruitment agencies are required to obtain confirmation of the identity of the work-seeker (*The Conduct of Employment Agencies and Employment Businesses Regulations 2003, paragraph 19*) prior to putting them forward as candidates. Most agencies look to interview their candidates and many agencies also contact previous employers to verify references. However neither of these steps actually confirm the candidate is who they say they are and both checks can be easily defeated by an identify fraudster.

By using iVet to validate the given identity at the outset you add real value to the recruitment process and offer your clients a clear indication that your agency stands out from the competition and that you deserve to be on their preferred supplier lists.

iVet CRB Service

As an extension to the iVet service, iSentry provides a secure and confidential managed CRB service. iVet will collect the additional information needed to complete the CRB form and present the completed form to the candidate or employee for signature. The iVet CRB process ensures a fast turnaround on checks and includes an active status reporting process to allow you to follow the application process from start to finish.

iVet Web Service interface

The iVet service can also be accessed via a web services interface allowing you to integrate the process directly into your own back office or HR operation.
